Introduction

This project implements a **menu-driven Logistics Management System** using the **C programming language** as a part of CSC 1012 It applies key programming concepts such as arrays, loops, conditionals, and functions to manage cities, delivery routes, and vehicle details in the system. The system calculates delivery time, cost, and fuel usage while maintaining a record of completed deliveries. It can also generate performance reports showing total deliveries, distances covered, and the shortest and longest routes.

Objectives:

- To design a simple logistics and delivery management system using the C language.
- To apply programming concepts such as arrays, loops, conditionals, and functions.
- To manage cities and record distances between them.
- To handle customer delivery requests and vehicle selections.
- To calculate delivery time, cost, and fuel consumption automatically.
- To store and retrieve delivery data using file handling.
- To generate performance reports showing delivery summaries and route details.

- Technologies Used:
 - > Programming Language C
 - > IDE CodeBlocks
- Github folder contains:
- Codefiles:
 - > main.c
 - > cityManagement.c
 - > distanceManagement.c
 - > vehicleManagement.c
 - > deliveryRequestHandeling.c
 - > calculations.c
 - > deliveryRecords.c
 - > fileHandeling.c
 - > findingBestRoot.c
 - > InterfaceMainMenu.c
 - > performance.c
- README.md
- Project Report

System Features

- 1. **City Management** Add,rename and remove cities from system according to the user's perspective.
- 2. Distance Management Enter, edit and view distances between cities.
- 3. **Vehicle Management** Select vehicles with different capacities, speeds, and fuel efficiencies.
- 4.**Delivery Request Handling** Place delivery orders by selecting source, destination, and package weight.
- 5. **Automatic Calculations** The system automatically calculates delivery cost, fuel cost, time, and profit.
- 6. **Performance Reports** Displays total deliveries, total distance covered, longest and shortest routes, and average delivery time.
- 7. **File Handling** Saves all route and delivery data into text files and loads them back when the program restarts.

• Main Structural Functions

cityManagement() Controls adding, renaming, and removing cities. cityManagement.c distanceManagement() Manages distances between cities (add, edit, and view). distanceManagement.c Displays available vehicles and allows selection for deliveries. vehicleManagement.c dilliveryRequestSection() Handles user input for delivery requests such as cities and package weight. deliveryRequest.c Calculates delivery cost, fuel consumption, time, total cost, and profit. calculations.c calculations.c FecordDilivery() Saves each delivery's data (source, destination, cost, etc.) into the records array. deliveryRecords.c Generates performance reports including totals, averages, and routes. performance.c saveRoutesToFile() Saves city names and distance data from the routes.txt. file. fileHandling.c loadRoutesFromFile() Loads city and distance data from the routes.txt file. fileHandling.c loadDiliveriesFromFile() Saves all delivery records and costs to deliveries.txt. fileHandling.c findShortestRouteIterative() Finds the shortest (least-cost) route between two cities using an iterative search. findingBestRoute.c	Function	Task	Location
distanceManagement() Manages distances between cities (add, edit, and view). Displays available vehicles and allows selection for deliveries. Handles user input for delivery requests such as cities and package weight. Calculates delivery cost, fuel consumption, time, total cost, and profit. Saves each delivery's data (source, destination, cost, etc.) into the records array. Generates performances() saveRoutesToFile() Loads city and distance data from the routes.txt. Loads previous delivery records and costs to delivery records and costs to deliveries txt. Finds the shortest (least-cost) route between two cities using an iterative distanceManagement.c distanceManagement.c distanceManagement.c distanceManagement.c distanceManagement.c distanceManagement.c distanceManagement.c distanceManagement.c distanceManagement.c deliveryRecords.c calculations.c calculations.c calculations.c deliveryRecords.c deliveryRecords.c deliveryRecords.c fileHandling.c fileHandling.c fileHandling.c fileHandling.c fileHandling.c	cityManagement()	Controls adding, renaming,	cityManagement.c
distanceManagement.c cities (add, edit, and view). Displays available vehicles and allows selection for deliveries. Handles user input for delivery requests such as cities and package weight. Calculates delivery cost, fuel consumption, time, total cost, and profit. Saves each delivery's data (source, destination, cost, etc.) into the records array. Generates performance reports including totals, averages, and routes. Saves city names and distance matrix to routes.txt. loadRoutesFromFile() Loads city and distance data from the routes.txt file. Loads previous delivery records and costs to delivery records fileHandling.c findShortestRoutelterative() cities (add, edit, and view). Displays available vehicles vehicles vehicles and allows selection for delivery records and costs to delivery wehicleManagement.c vehicleManagement.c deliveryRecords. deliveryRecords.c deliveryRecords.c deliveryRecords.c deliveryRecords.c fileHandling.c fileHandling.c fileHandling.c fileHandling.c fileHandling.c fileHandling.c		and removing cities.	
cities (add, edit, and view). Displays available vehicles and allows selection for deliveries. Handles user input for delivery requests such as cities and package weight. Calculations() Calculates delivery cost, fuel consumption, time, total cost, and profit. Saves each delivery's data (source, destination, cost, etc.) into the records array. Generates performance reports including totals, averages, and routes. Saves city names and distance matrix to routes.txt. Loads city and distance data from the routes.txt file. Loads previous delivery loadDiliveriesFromFile() Loads previous delivery saveDiliveriesToFile() Displays available vehicles vehicles vehicles and allowers such as cities using an iterative vehicleManagement.c velicleTessure vehicleManagement.c velicleTessure vehicleManagement.c velicleTessure velicleTessure velicleTessure ve	distanceManagement()	Manages distances between	distanceManagement.c
vehicleManagement() and allows selection for deliveries. vehicleManagement.c diliveryRequestSection() Handles user input for delivery requests such as cities and package weight. deliveryRequest.c Calculates delivery cost, fuel consumption, time, total cost, and profit. calculations.c Saves each delivery's data (source, destination, cost, etc.) into the records array. deliveryRecords.c generates performance reports including totals, averages, and routes. performance.c saveRoutesToFile() Saves city names and distance matrix to routes.txt. fileHandling.c loadRoutesFromFile() Loads city and distance data from the routes.txt file. fileHandling.c loadDiliveriesFromFile() Saves all delivery records and costs to deliveries.txt. file. fileHandling.c saveDiliveriesToFile() Finds the shortest (least-cost) route between two cities using an iterative findingBestRoute.c		cities (add, edit, and view).	
deliveries. Handles user input for deliveryRequestSection() Calculates delivery cost, fuel consumption, time, total cost, and profit. Saves each delivery's data (source, destination, cost, etc.) into the records array. Generates performance reports including totals, averages, and routes. Saves city names and distance matrix to routes.txt. Loads city and distance data from the routes.txt file. Loads previous delivery records and costs to deliveries.txt file. Saves DiliveriesToFile() Saves all delivery records array. Generates performance reports including totals, averages, and routes. Saves city names and distance data from the routes.txt. Loads city and distance data from the routes.txt file. Loads previous delivery records from the deliveries.txt file. Saves all delivery records and costs to deliveries.txt. Calculations

```
D = Distance (km)

R = Rate per km (LKR)

W = Weight (kg)

S = Speed (km/h)

Fuel Used = Fuel consumption (liters)

Fuel price (310 LKR per liter)

E = Fuel Efficiency (km/l)

Cost = D × R × (1 + W × 1/10000)

Estimated Delivery Time (hours) = = D / S

Fuel Consumption = D / E

Fuel Cost (LKR) = FuelUsed × F

Total Operational Cost (LKR) = DeliveryCost + FuelCost

Profit Calculation (LKR) = Cost × 0.25 (25% markup on base delivery cost)

Final Charge to Customer (LKR) = TotalCost + Profit
```
